

# Involving Patients and Clinicians in Research on Frailty and AI

Lara Johnson

# The Topic

PhD Project: What do  
data tell us about frailty?

# Some Communication Challenges

- Limited public awareness
- Low correlation between perceptions and the medical literature
- Negative connotations / stigma
- Existing content on frailty of a predominantly **technical** nature and aimed at healthcare professionals
- **Extremely limited online information resources** on frailty for the general public

## Perceptions among older people and informal carers

Age UK and the British Geriatrics Society (2015). Frailty: Language and Perceptions

# Patient and Public Involvement (PPI)

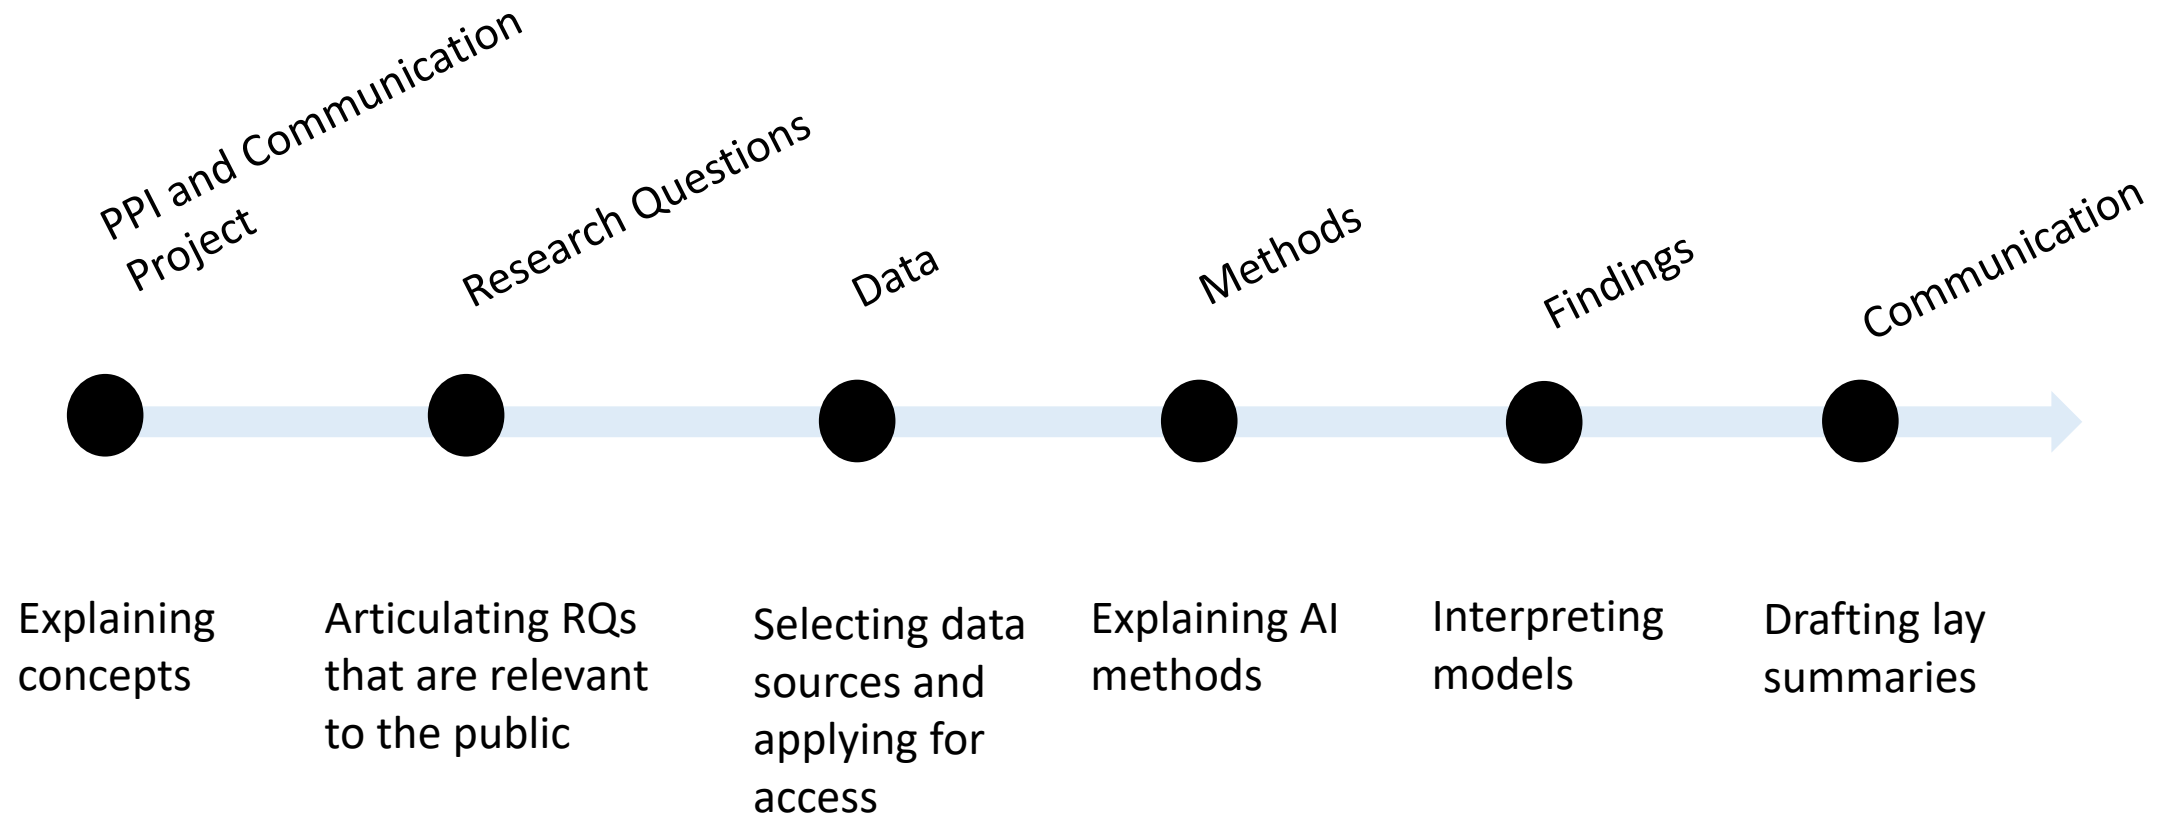

“Public involvement in research means research that is done ‘with’ or ‘by’ the public, not ‘to’, ‘about’ or ‘for’ them. It means that patients or other people with relevant experience contribute to how research is designed, conducted and disseminated”

# Including Patients and Clinicians in the Team

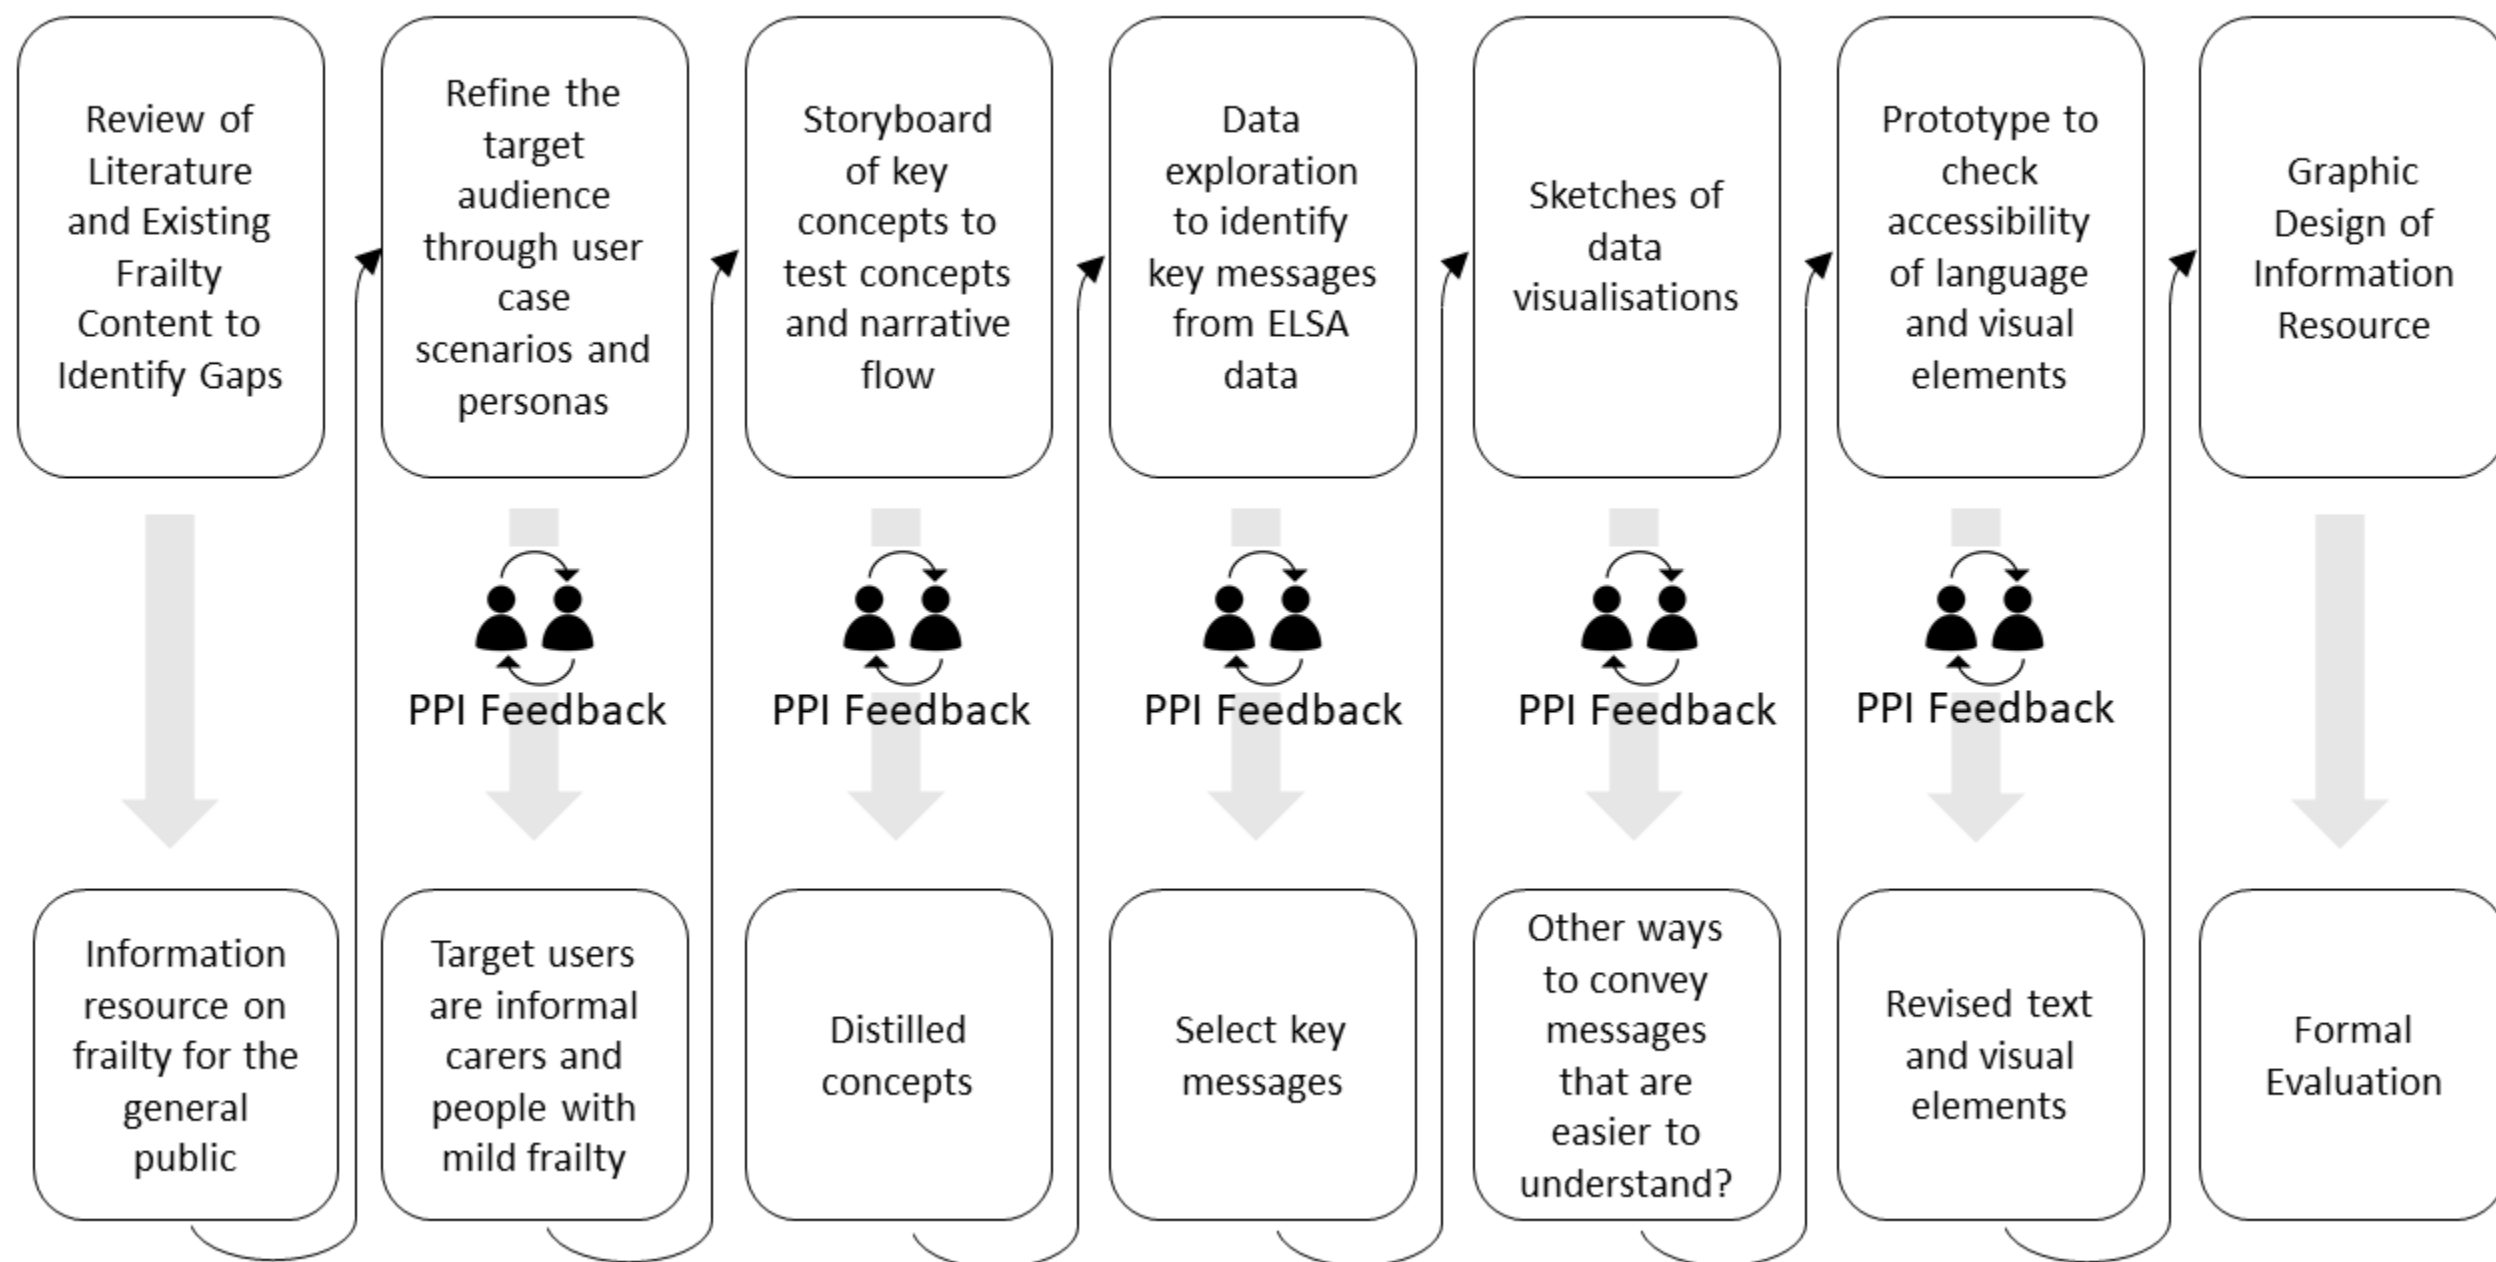

- Lara Johnson, PhD Student
- Dr Sohan Seth, Lead Data Scientist
- Dr Atul Anand, Consultant Geriatrician
- Professor Alan Marshall, Social Research on Inequality
- Professor Bruce Guthrie, GP
- PPI Group of lay people in later life

# Embedding PPI in the Project Timeline

- **Co-designed with members of the public** to ensure relevance and accessibility
- All key messages **grounded in data**
- **Visual elements** used to enhance text-based content

THE UNIVERSITY  
of LONDON

Coull, Andrew <Andrew.Coull@nhslothian.scot.nhs.uk>

Frailty info

To  Lara Johnson

Hi Lara

I hope you are well. I wanted to give you an update on the frailty work and the positive impact of the poster / leaflet and get your 'permission' for wider sharing.

We made the leaflet into a massive poster which is in all the community hospitals and day hospitals.

We use the leaflet in conversations with our patients when discussing frailty with them and their families.

I have referenced the leaflet in talks to GPs and on RefHelp (GP referral system for GPs for all specialities) and hope to send out to all Lothian GPs when we aim to encourage them to use the Clinical Frailty scale.

So...absolutely brilliant and very far reaching!

Are you okay with me sharing with GPs and as a resource on Ref Help?

Best wishes

Andrew

# Background – The Clinical Context

Frailty reflects a state of **increased vulnerability** to adverse health outcomes for individuals of the same chronological age

- Counts the number of health deficits someone has
- The burden of frailty grows as people accumulate more health deficits
- Can be quantified in a frailty index
- Uses pre-existing data

# How a Frailty Index Works

Gather data from  
electronic health records

**Calculate frailty scores**

$$\text{Frailty Index} = \frac{\text{Number of health deficits}}{\text{Number of health deficits measured}}$$

Categorise patients

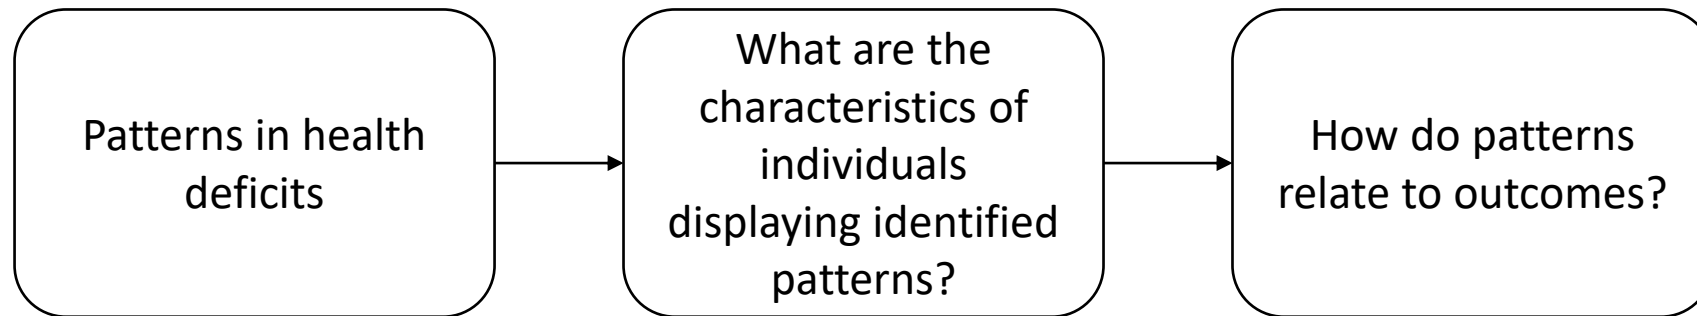

Make clinical decisions

Additional GP appointments, polypharmacy reviews, referrals, treatment

# Research Questions

Aim: Identify subtypes of frailty

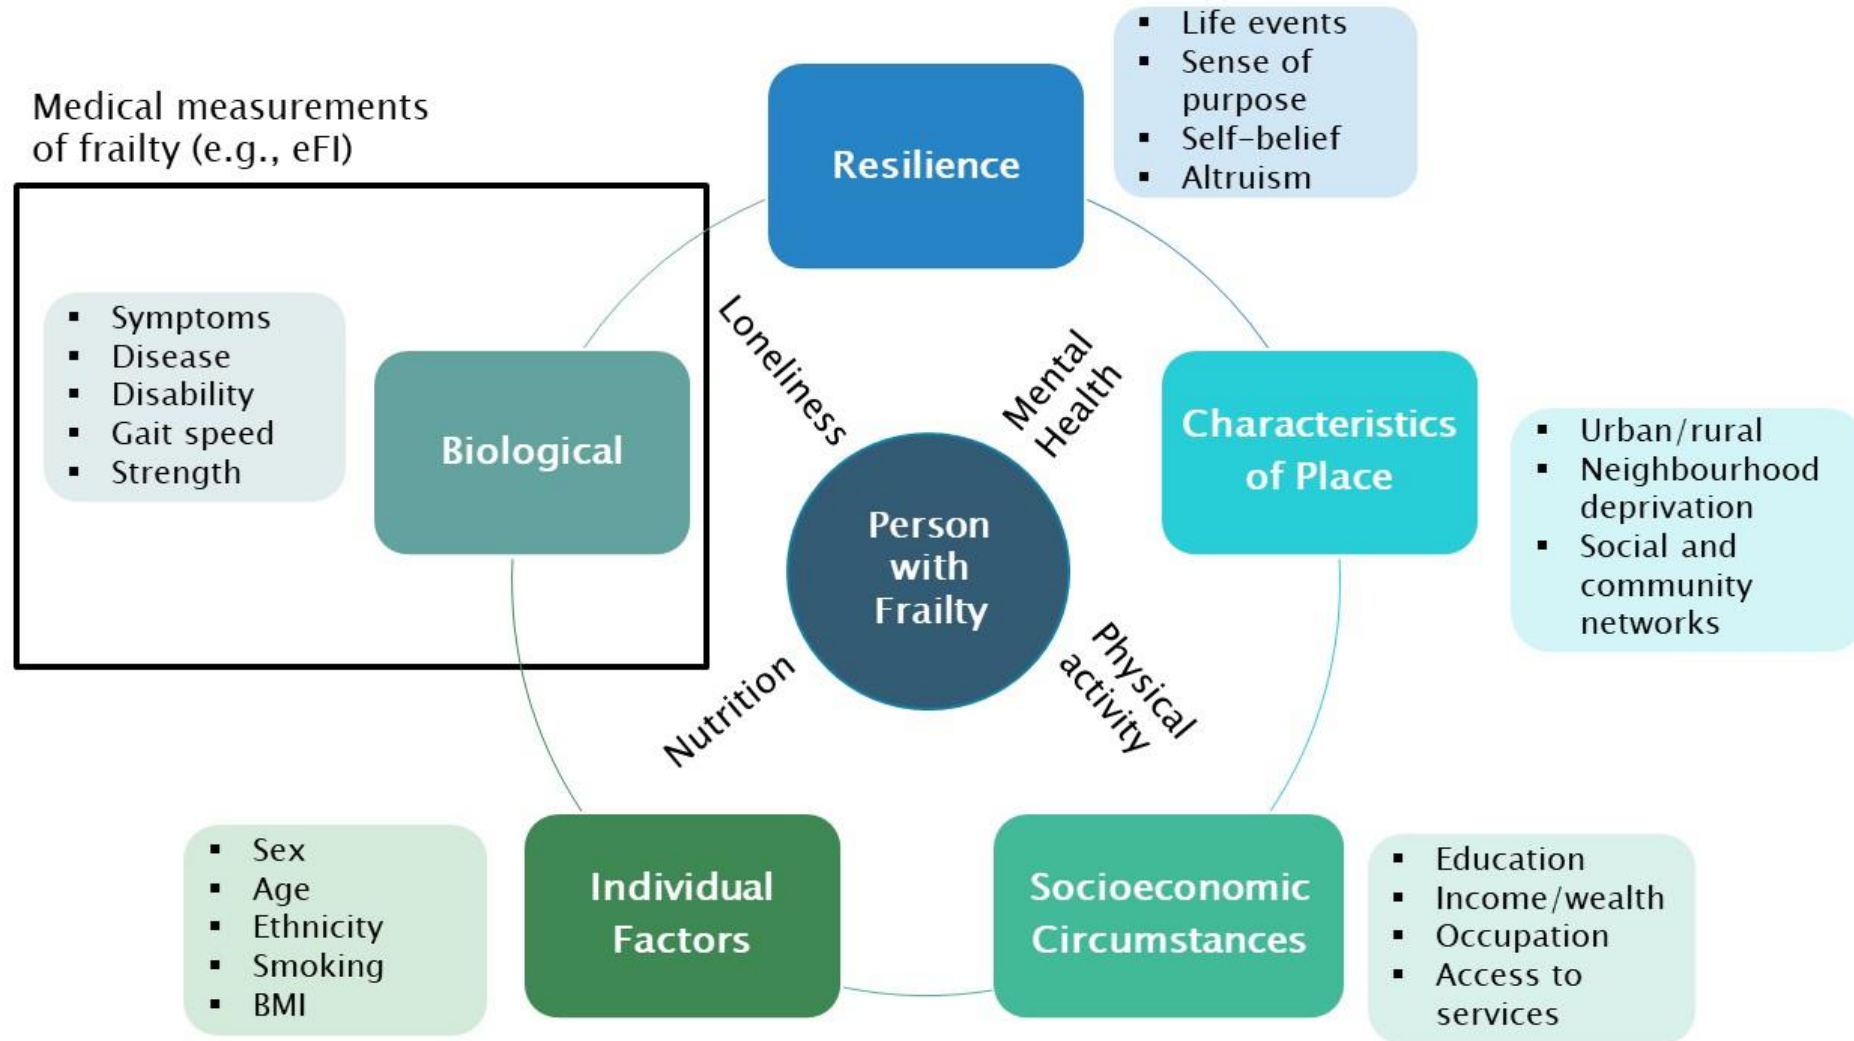

Do findings replicate in survey data and EHR?

Do findings make sense to patients and clinicians?

# Viewing Frailty Holistically

# Choosing the Data Sources

PPI Input on  
Detailed  
Protocol

1 General information
Protocol reference Id 23_002557
Study title Artificial Intelligence and Frailty: Discovering Frailty Subtypes with Different Prognostic Profiles
Research Area Disease Epidemiology
Does this protocol describe an observational study using purely CPRD data? Yes
Does this protocol involve requesting any additional information from GPs, or contact with patients? No

Page 1 of 23

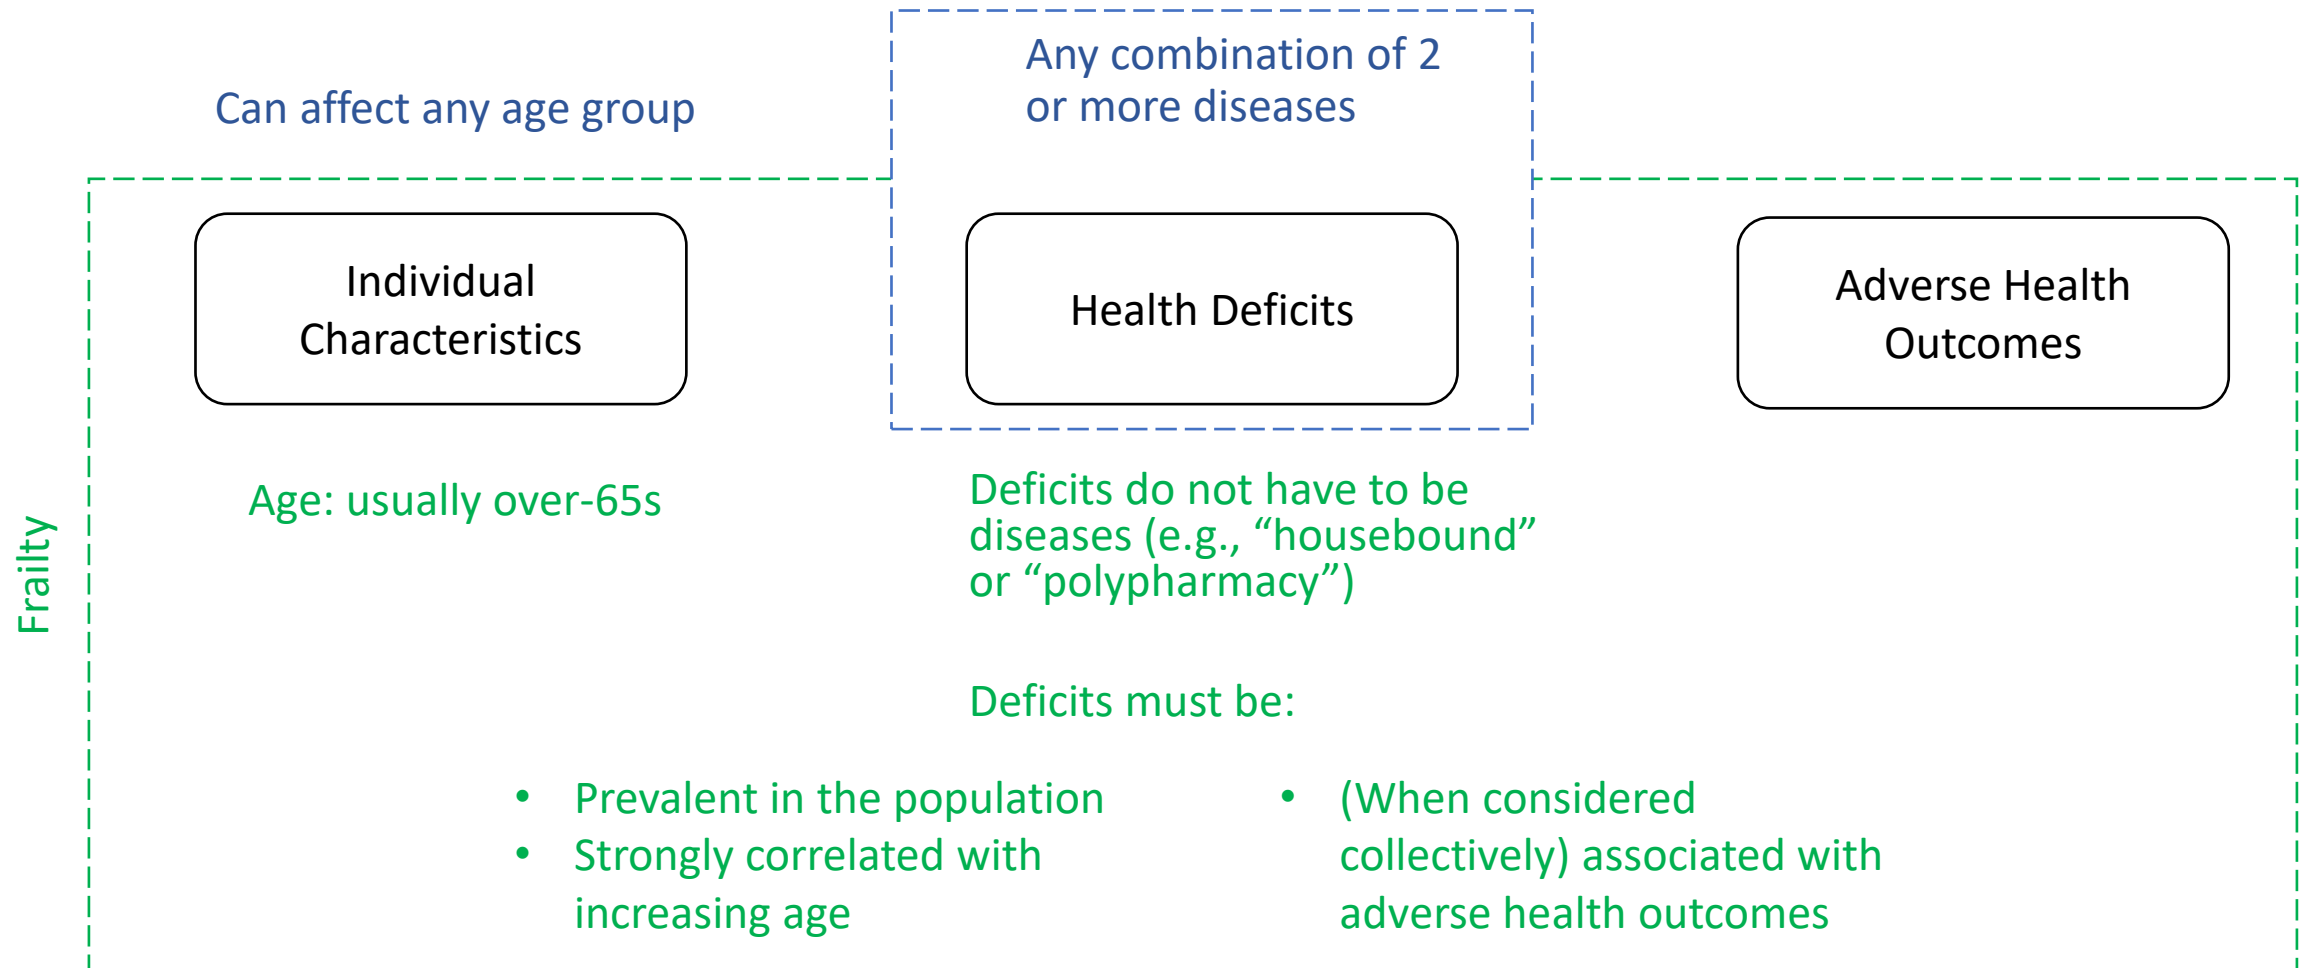

- N ~ 10,000 community-dwelling adults aged 50+ in England
- 2002-2019

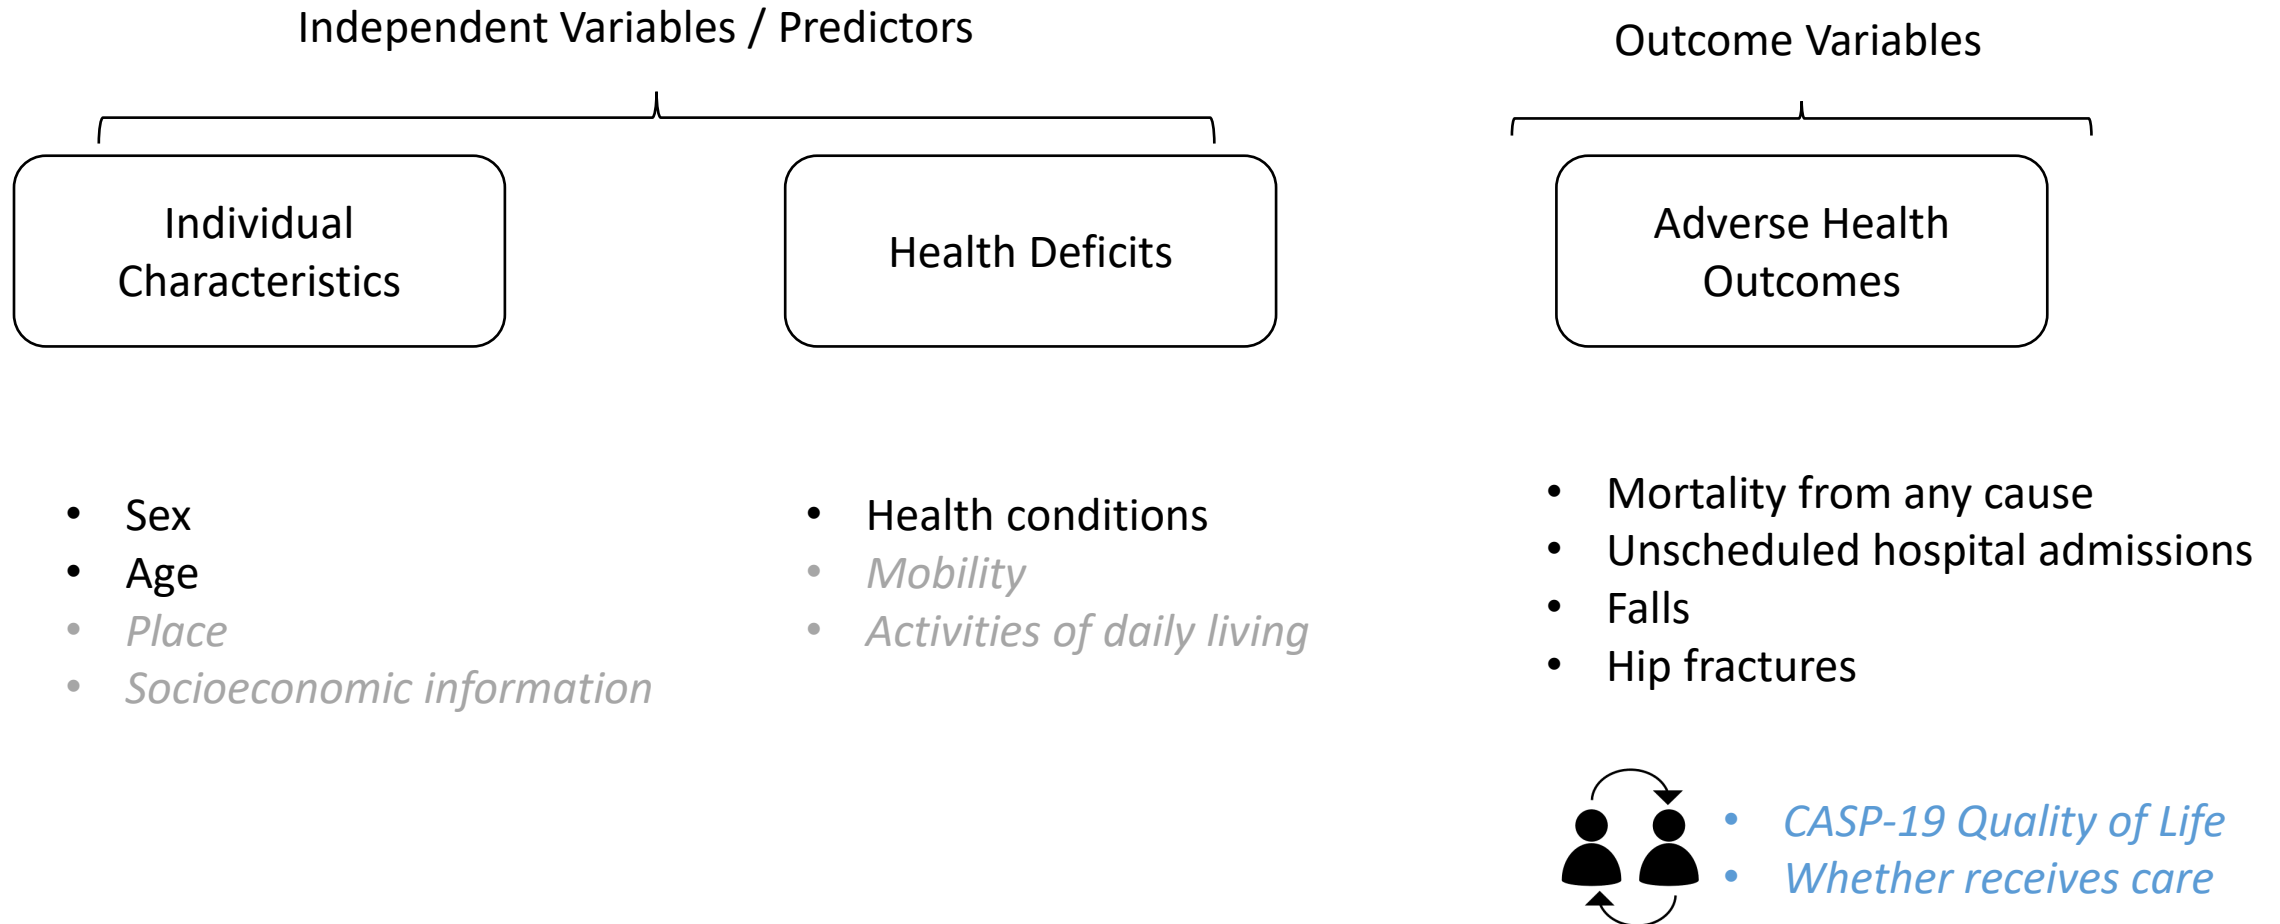

Clinical Practice Research Datalink

- N ~ 3.5m patients aged 50+ in England registered with a GP > 1 year
- 2010-2019

# Distinguishing **frailty** from **multimorbidity**

# Selecting the Variables of Interest

# Defining the Study Population

Respondents aged 65+ in  
Wave 9 (2018-2019) with  
missing data < 20 deficits

	Men		Women		Total	
	N	%	N	%	N	%
<b>N</b>	2156	43.4%	2815	56.6%	4971	
<b>Age (Years)</b>						
65-69	563	26.1%	731	26.0%	1294	26.0%
70-79	1052	48.8%	1293	45.9%	2345	47.2%
80-89	483	22.4%	670	23.8%	1153	23.2%
90+	58	2.7%	121	4.3%	179	3.6%
<b>Number of Deficits</b>						
0	122	5.7%	108	3.8%	230	4.6%
1-5	1145	53.1%	1178	41.8%	2323	46.7%
6-10	464	21.5%	679	24.1%	1143	23.0%
11-15	200	9.3%	376	13.4%	576	11.6%
16+	225	10.4%	474	16.8%	699	14.1%
<b>Number of Deficits, mean (SD)</b>	6.56 (6.29)		8.54 (7.31)		7.68 (6.96)	
<b>Frailty index score, mean (SD)</b>	0.113 (0.109)		0.147 (0.126)		0.132 (0.119)	
<b>CASP-19 score, mean (SD)</b>	42.80 (7.90)		42.50 (8.27)		42.64 (8.11)	

# Using Interpretable Methods

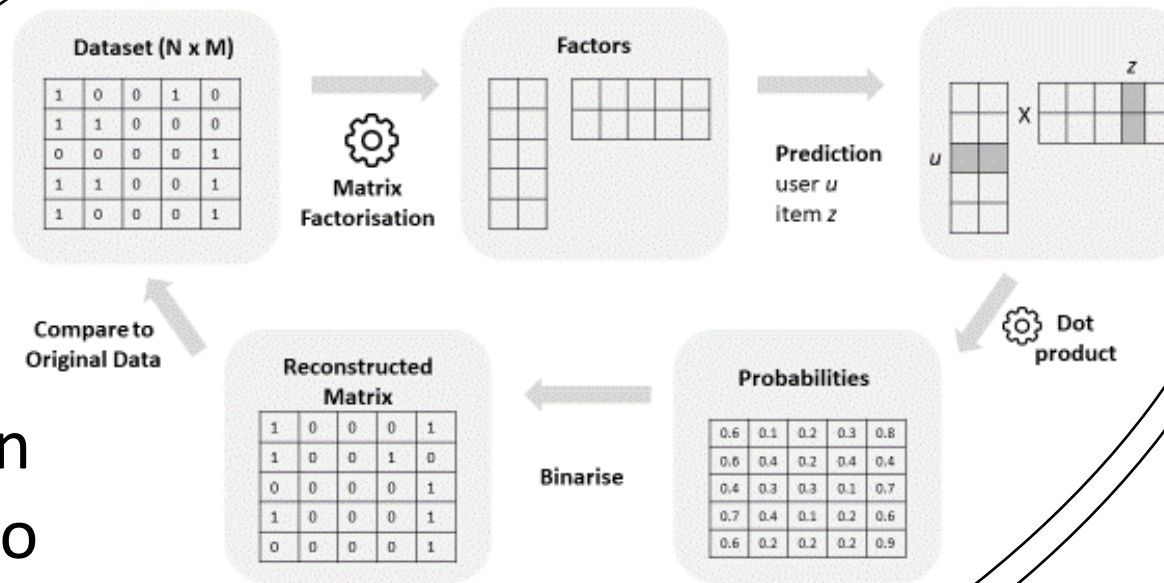

# Boolean Matrix Factorisation (BMF)

Identifies groups of patients and groups of deficits

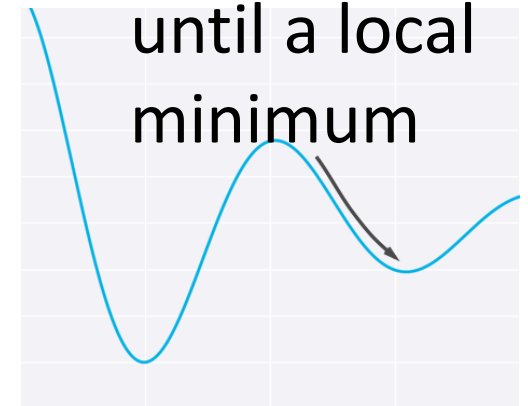

# Iteration with Expectation Maximisation

Initialise two matrices  $U$  and  $Z$

Update the values in  $U$  and  $Z$  iteratively to minimise the difference between  $X$  and  $U \cdot Z$

Converges until a local minimum

# Model Evaluation and Selection

**Reconstruction Error**

$$\text{err} = |\widehat{X} - X| / (NM)$$

**Interpretability**

Do factors make sense to  
doctors and patients?

**Prediction accuracy**

Do factors better  
predict outcomes?

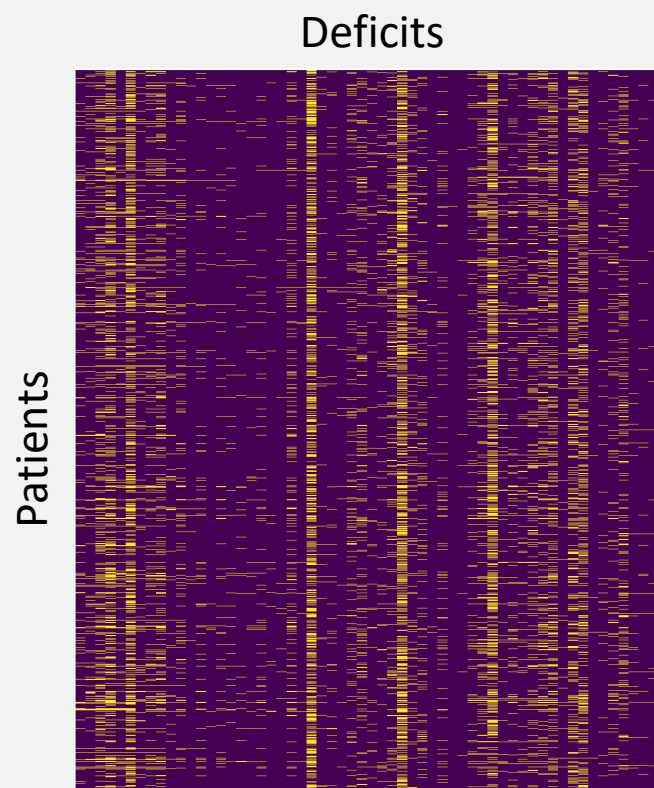

# Visualising the Data

	Chronic Disease	Cardiovascular	Activities of Daily Living	Mobility	Psychological	Memory
ID	Arthritis	Heart-attack	Difficulty managing money	Difficulty walking	Depressed	Does not remember the year

# Reconstructing the Data

Predicted Probabilities

**Binarise**

Reconstructed Matrix ( $K = 4$ )

**Compare to  
Original Data**

Original Data

0

1

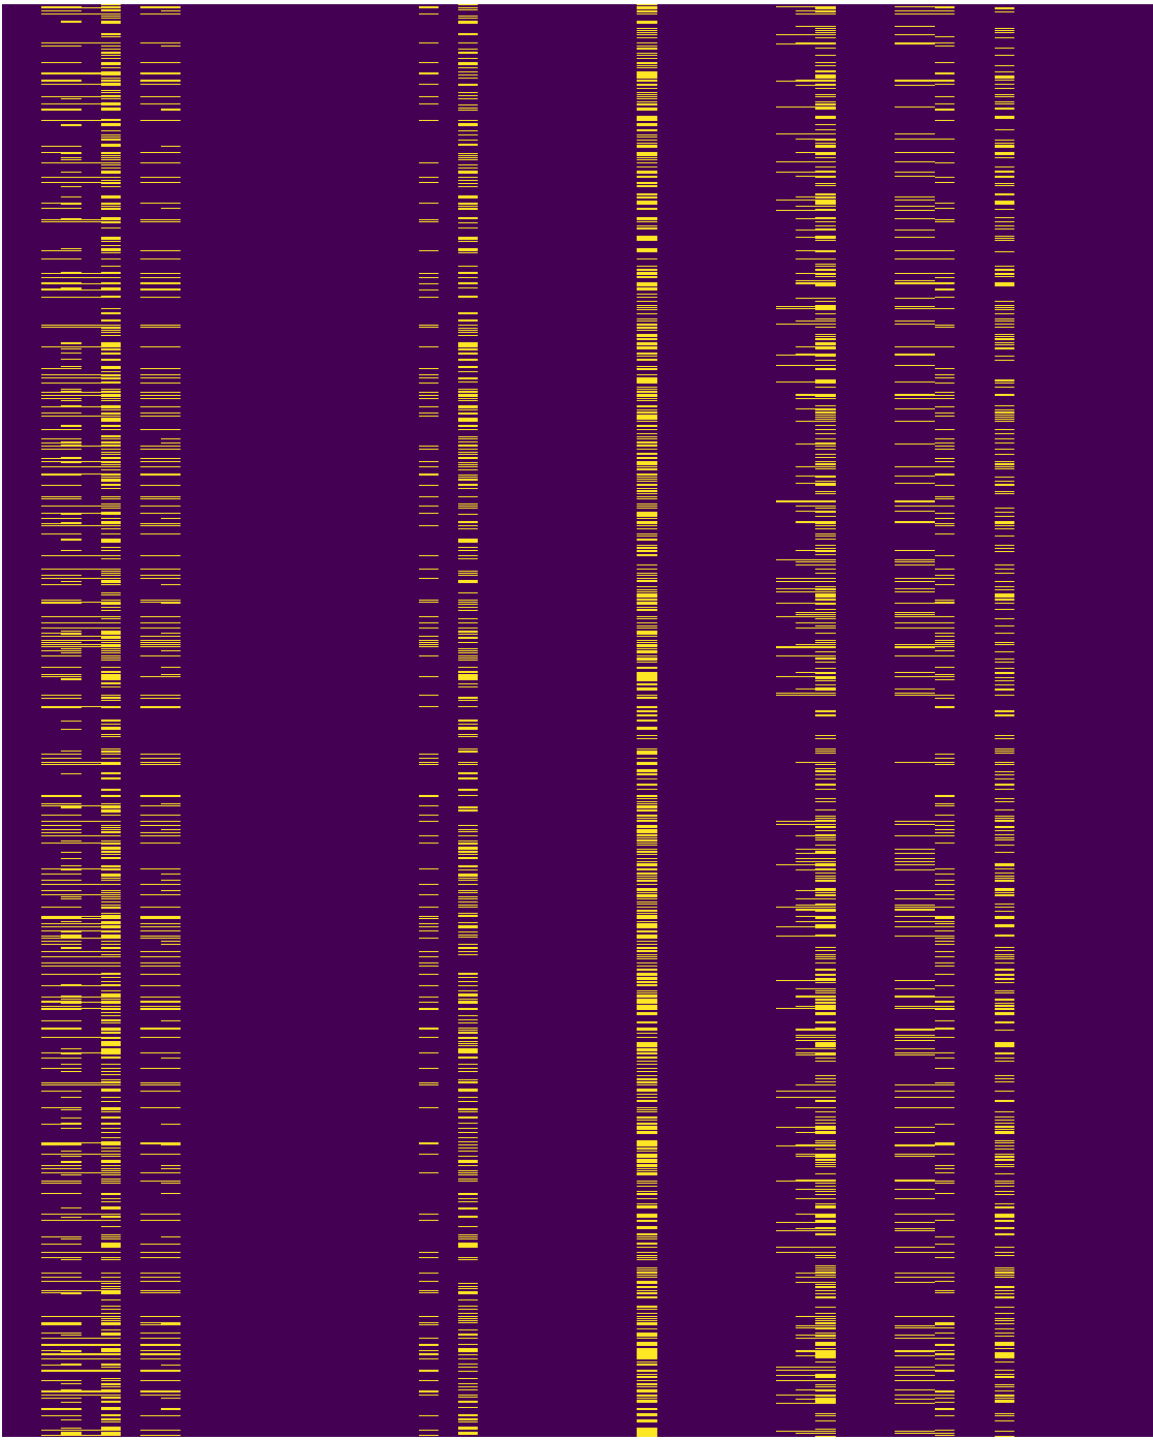

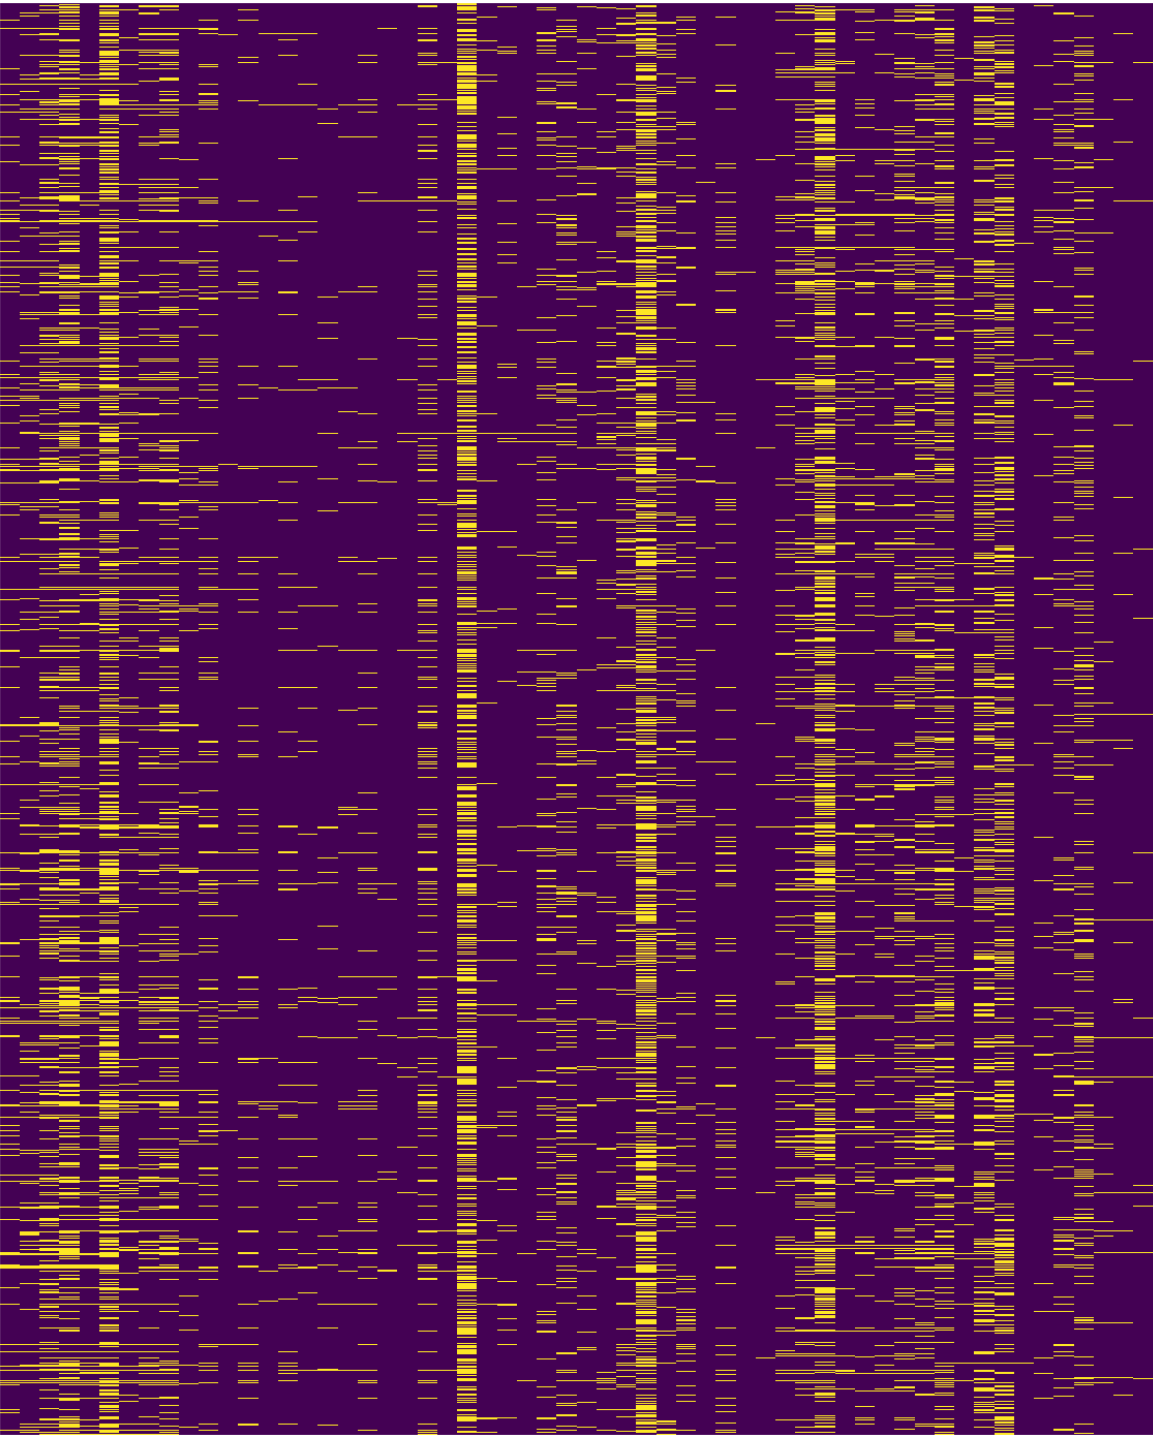

0 = No Deficit

1 = Deficit Present

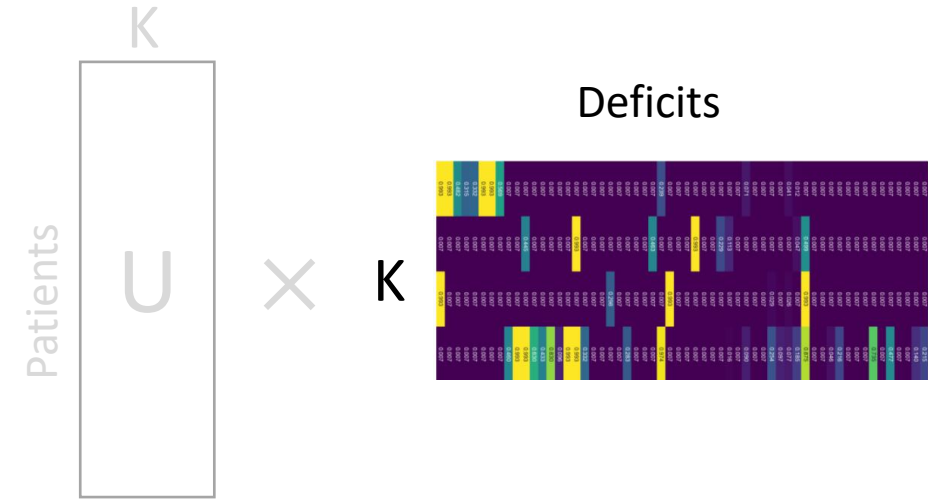

Original Data

Reconstructed Matrix ( $K = 4$ )

# Interpretability

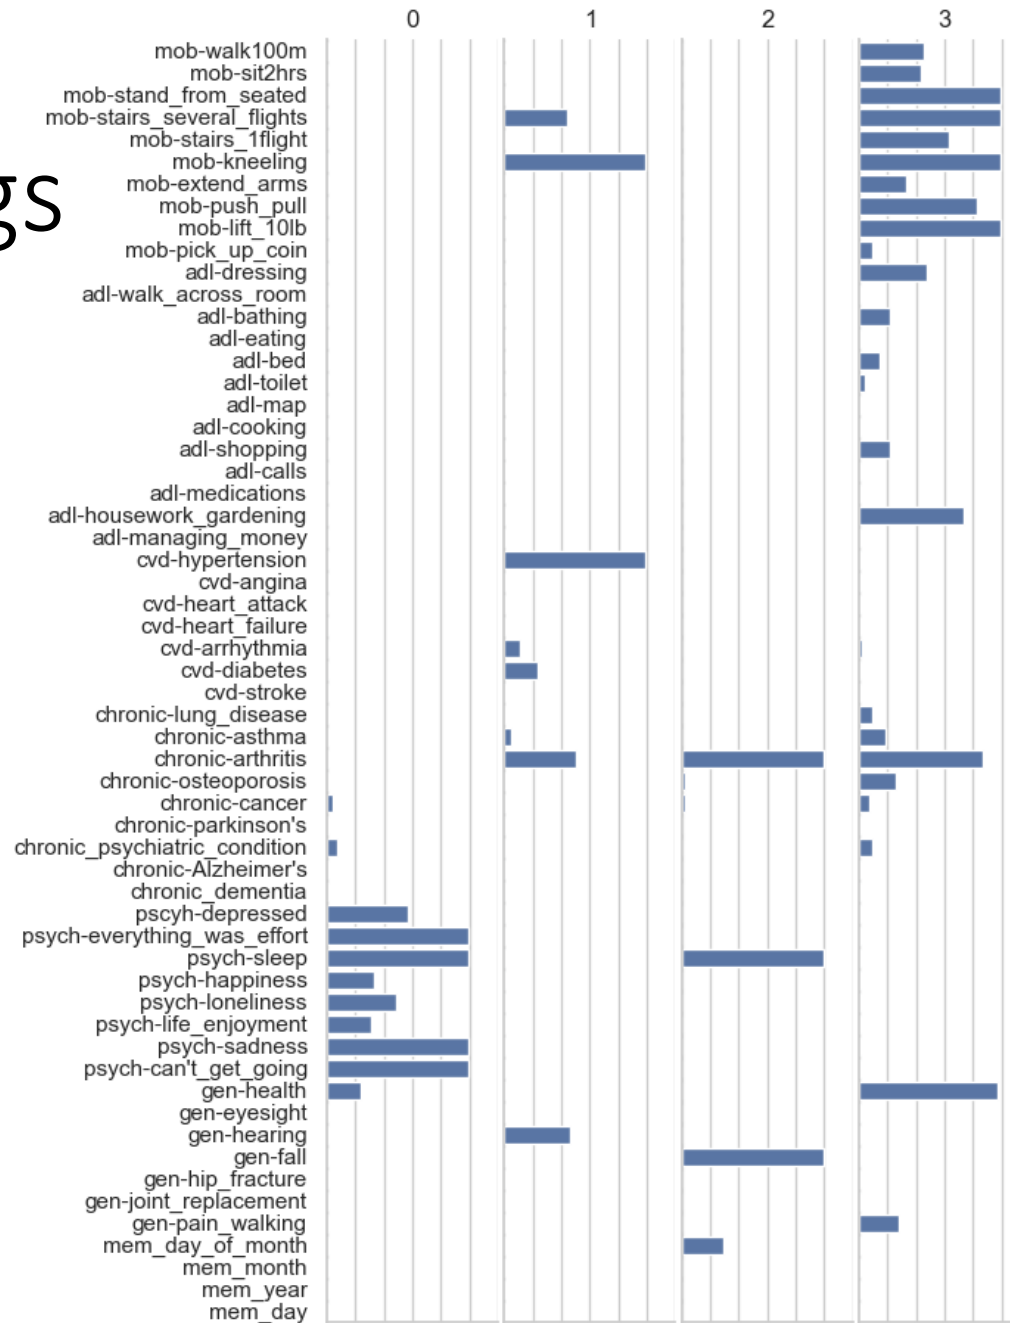

- Saliency of factor loadings ( $> |0.20|$ )
- Factors with a minimum of three salient deficit loadings
- Deficits load highly onto one factor
- Parsimony (simpler model with fewer parameters)
- Theoretical meaningfulness

# Deficit Loadings

Feedback  
from PPI  
mentor and  
clinicians

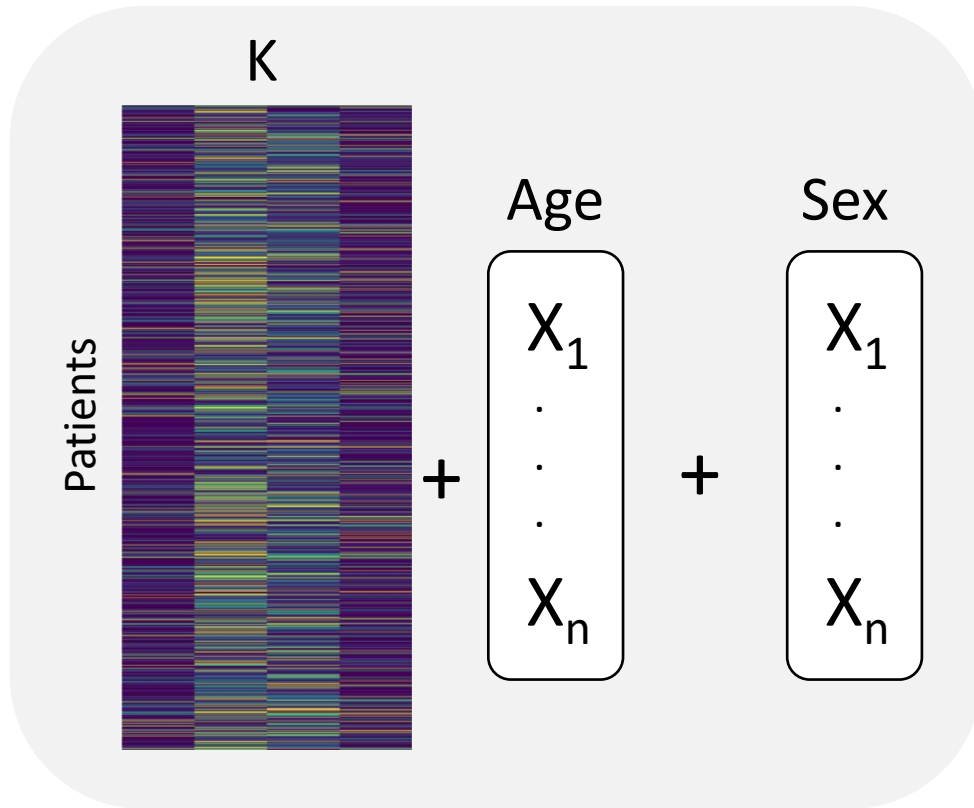

# Four subtypes of frailty?

1. Mobility Impairment and Physical Morbidity
2. Difficulties in Daily Activities
3. Mental Health
4. Disorientation in Time

# Predicting care needs

Boolean Matrix Factorisation

Logistic Regression

Receives care

Does not  
receive care

# Test Accuracy: 91.3%

# Future Work

- Methodological contribution for sparse data > improve outcomes prediction
- Investigating the relationship between the factors and patients' individual characteristics
- Replicating in electronic health records (CPRD)

# Patients and Clinicians involved through:

- Inclusion in the research team
- Guiding the research direction
- Evaluating and selecting model
- Interpreting results
- Outreach

# Thank you!
